

HW1:

請描述以下程式碼在 C++與 JAVA 中執行的結果(無視語法錯誤)

```
class Dog{  
  
    bark(){  
        print("bark!!")  
    }  
}  
  
main(){  
  
    Dog dogs[3];  
  
    for(int i=0;i<3;i++){  
        dogs[i].bark();  
    }  
}
```

Ans:

C++ :

bark!!

bark!!

bark!!

Java :

Runtime error (NullPointerException)

the array only stores references initialized to null, so calling a method results in a NullPointerException.

HW2:

If I want to swap two variables in Java, how should I do it?

Please write some Java code to show your answer.

Ans:

```
public class Main {  
    public static void main(String[] args) {  
        int a = 5;  
        int b = 10;  
  
        int temp = a;  
        a = b;  
        b = temp;  
  
        System.out.println("a = " + a);  
        System.out.println("b = " + b);  
    }  
}
```
